Greetings ClayPeople!

We are entering our 54th year of serving you!

We are all part of a special timeless tribe of ClayPeople. This family has a vertical and horizontal axis. The vertical family axis are the ClayPeople who have created with clay through the ages. When archaeologists find human remains, they usually find evidence of pottery.

The horizontal family axis are the ClayPeople who, at any given point in time, are creating in clay around the world. A fascinating variety of ceramic creations exist in all societies.

We work hard to be a strong nexus point in this ClayPeople tribe continuum: to answer every one of your questions, and find every product you need.

Your ideas and questions always help shape ClayPeople. We are committed to be "Friendly Experts" and to have a "Huge Inventory" of both products and knowledge.

We take great pride in always working to strengthen our position as "Northern California's Leader in Ceramic Supply." Thank for allowing us to be a nexus in your ClayPeople tribe continuum!

TEXTURIZERS, WAX & ADDITIVES

TH-1 is a rutile-based mid-fire texturizer. When layered with other glazes, it produces a floating, flowing texture.

Apply TL-1 Texturizer over any Cone 05 glaze to create different textures. Surface textures vary depending on the type of base glaze (gloss, matte, or textured), broadening the glaze palette tremendously. An even wider variety of effects can be achieved by applying TL-1 between coats of two different Cone 05 glazes.

Colorant Information

CHROME OXIDE - Cr₂O₃ is used (in small amounts <2%; it is very refractory) to produce greens. This Oxide has a chameleon-like effect on glazes depending on the choice of temperature and flux source, i.e. KNaO, CaO BaO, or MgO. Used with Tin, it produces pink, but with Zinc Oxide it produces brown.

COBALT CARBONATE - CoCO₃ is used to produce blues in glazes. It is sometimes preferred over the Oxide form due to its particle size, thus eliminating ball milling. Cobalt Oxide can substitute for the Carbonate form if used in one-half the given amount. Can also be used with Manganese, Iron Chromate, or Nickel to produce strong blacks.

COBALT OXIDE - Co₃O₄ is the major oxide used for producing blues. It gives comparable tints of blue in almost all firing ranges and varying firing methods. It's a very strong colorant (typically <2% is used). Glazes employing it as a colorant should be ball milled if mottling is not desired. When using Cobalt Carbonate the amount should be doubled.

COPPER CARBONATE - CuCO₃ is the most common source for Copper Oxide and is used (2%-5%) as a major colorant to produce greens, turquoise, and copper reds. Carbonate form is preferred over the oxide due to finer particle size, which enhances production Alkaline glazes: turquoise in oxidation, and copper red in reduction. Volatile above cone 8 and may require a sagger to protect other ware and kiln.

COPPER OXIDE BLACK - (CuO) RED (Cu₂O) are the two stable forms of Copper Oxide. Both forms are coarser in particle size than Copper Carbonate. The more common of the two forms (in a glaze) is copper black (2%-5%). It is a strong flux used as a colorant to produce greens in oxidation and reds in reduction. Red Copper Oxide can be precipitated during reduction firings as a component of a copper red glaze finish. Other colors are turquoise in Soda based glazes, yellow-greens in Potash, and blue-greens in Barium. Copper Carbonate can be substituted for Oxide if the amount is doubled.

IRON OXIDE - Red: Fe₂O₃ Iron Oxide is the most commonly used form of Iron as a colorant in glazes and clay bodies. Used most often to produce brown colors. In amounts greater than 4% it can react as a flux, increasing fluidity of the glaze. Black: FeO Iron Oxide as a colorant will create a variety of colors depending on the glaze base used. Effect is often the same as Red Iron Oxide. However, it is preferred for producing celadon glazes in reduction firing.

MANGANESE DIOXIDE - MnO₂ is a source of MnO in glazes or clay bodies, and is used to develop reds, blues, purples, and black (MnCO₃ is a weaker colorant per unit weight of MnO than MnO₂, at a minimum, twice the amount is needed). It is a vigorous flux (cone 5-10) in glaze and clay bodies (in a clay body use <5%), and a strong oxidizing agent in glazes. Powder and granular forms differ by particle size and reactivity. Granular form can be used at higher temperatures where the reduced reactivity will develop dark speckles in both clay bodies and glazes.

NICKEL OXIDE - Green: NiO Green Nickel Oxide (typically <3%) is used in glazes (most commonly porcelain enamels) to produce blues, greys, browns, and yellows, depending on molecular equivalence of the Alkaline earths chosen. It can also be used to soften the effect of Cobalt and Copper colorants. Black: Ni₂O₃ in a glaze Black Nickel Oxide will reduce to Green Nickel Oxide at 600o C and produces similar results as NiO. Greater amounts may need to be added to a glaze to achieve the same effects.

RUTILE - TiO₂ is an economical source of TiO₂ when pure white is not required. Used in clay bodies and glazes (typically 1-3%) to produce ivory to yellow to dark tans in oxidation, and purples and blues in reduction. Used to modify action of other colorants and to produce special effects like mottling and streaking especially in Gerstley Borate/Colemanite glazes. Light Ceramic is a fine size true Rutile with some Iron contamination. Granular is a coarse particle size true Rutile with some Iron contamination. The granular form is less reactive than the Light Ceramic grade and therefore, is used to promote mottling at higher temperatures (cone 8-13).

SILICON CARBIDE BLACK - SiC contains up to 10% Free Silica and is highly refractory. It is used mainly in high temperature kiln furniture (cones 5-16), and has been experimented with in Alkaline glazes in amounts of 0.5 to 1.0% to produce artificial copper reds.
